Dragons are among us! We're talking about Moana, the bearded dragon that resides at ZooMontana. Under their mouth, bearded dragons have an expandable throat that not only is covered in spikes but can turn color! That's not the only part of their body that's spiky either. In fact, bearded dragons have spines all over their body to protect them from predators!

Bearded dragons are native to central and eastern Australia and are very common pets. But don't worry, no pet bearded dragon is taken from the wild to become a pet! Australia outlawed taking bearded dragons for pets in the 1960s. These animals are omnivores, eating a variety of insects, fruits, and leaves.

- Bearded dragons can turn their scales darker colors to help them control their body temperature. They can also turn them darker if they are feeling agitated.
- Bearded dragons don't make many sounds and instead communicate with one another by waving their front legs and bobbing their heads.
- Bearded dragons are diurnal or awake during the day.

Color in this bearded dragon! They come in a variety of different colors!

Help Moana find some of her favorite foods! Draw a line between her and the foods that were mentioned on the first page!

Help Moana get to the other side of the maze!
