Oro is the golden eagle that lives at ZooMontana. Golden eagles are large, solitary birds of prey. They are also one of the largest birds here in North America! Due to their habitat requirements, in the United States, golden eagles are found in habitats west of the Rocky Mountains.

Golden eagles can be found all over the world and are significant to many different cultures! In North America, many Indigenous tribes revere the bird's power and strength and ascribe mystical abilities to its feathers. In Mongolia, the Kazakh people have been using golden eagles to hunt for thousands of years.

- Golden eagles are fierce carnivores, they eat small animals like mice, voles, and rabbits. They can also catch and eat larger prey like foxes and even pronghorn!
- Golden eagles are solitary animals, and usually only come together to mate.

Color in this golden eagle as they swoop in on their meal!

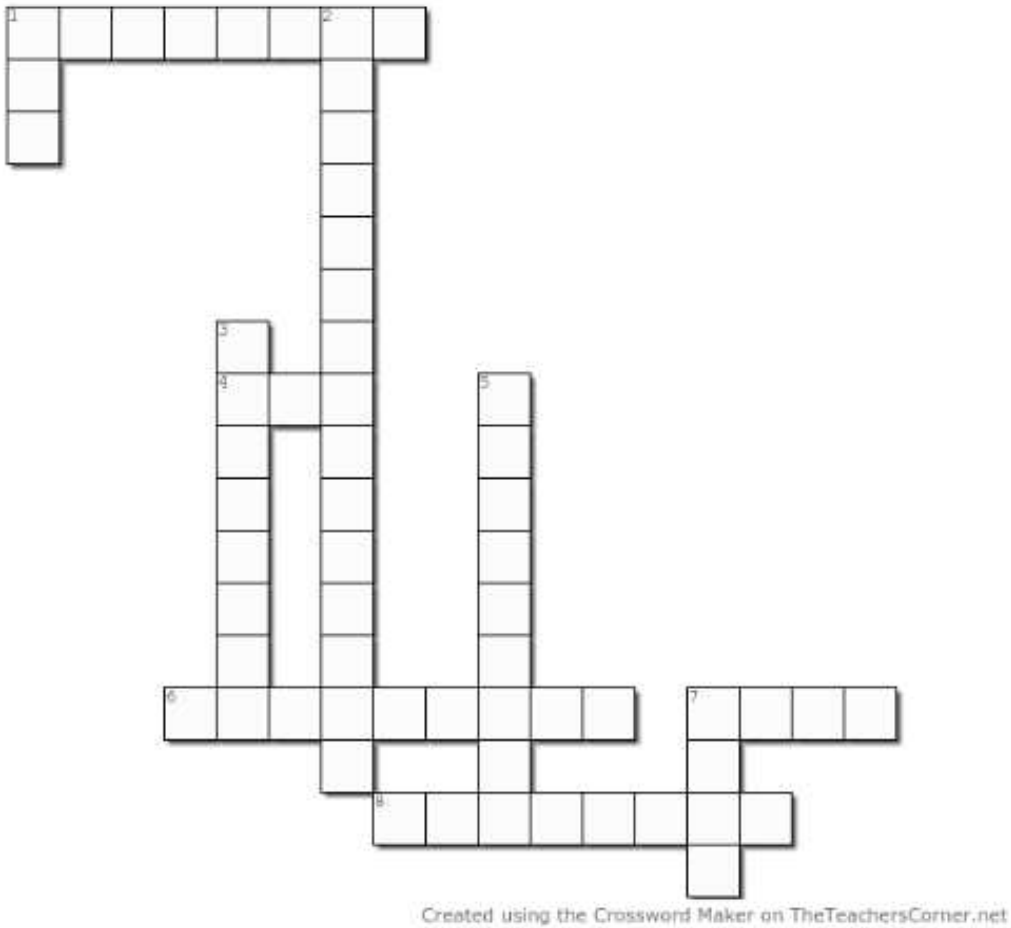

Oro has a damaged wing because he was hit by a car and cannot fly. With two full wings, a golden eagle's wingspan can be between 5.5ft – 7.5ft long! That's taller than lots of human beings! Color this golden eagle as they soar through the air!
