Have you met Uki the North American badger? Often, she can be found underground in the tunnels she digs in her habitat with her long claws! Badger tunnels can be up to 8 feet deep and 30 feet long. Some can even have multiple entrances!

Because they spend so much time underground in their tunnels, North American badgers are what scientists call fossorial – meaning living underground. This means they eat lots of other animals that live underground like voles, gophers, mice, and even rattle snakes! Badgers use their long claws and incredibly strong arms to big underground to their prey.

- North American badgers like Uki are active at night, meaning she's nocturnal!
- Coyotes and badgers have been known to work together while hunting to find food!

Color in this badger pair and their surrounding habitat!

What kind of foods would Uki like to eat? Draw a line from her to some of a badger's favorite foods!

Help Uki the badger tunnel her way through the maze!
